

TRUST INTELLIGENCE · MAKE TRUST YOUR NORTH STAR

How we measure. How we listen.

Solmax already has a reading — 58, from public signal alone. This is what it takes to replace an estimate with evidence, and keep it moving wave after wave.

Prepared for **Karen Lubbe**

Prepared by **Dustin Lawrence · MissionCTRL**

August 2026 · Co-design input

Eleven things, in order.

- 01 What TrustOS reads
- 02 The evidence
- 03 Where Solmax stands today
- 04 Sense · Measure · Act
- 05 How we listen
- 06 How we do the surveys
- 07 The three tests
- 08 Six weeks to the baseline
- 09 The Signal Atlas
- 10 Built on what's moving
- 11 What happens next

READ THIS FIRST

“Trust isn't an opinion about us — it's the state of the relationship.”

One thing measured. Trust.

Solmax measures everything it **does** — and almost nothing about how it is **experienced**. TrustOS reads the state of every stakeholder relationship, and warns you before the numbers move.

Trust isn't an opinion about you. It's the state of a relationship with you.

DRIVER 01

Clarity

What's said. Do people understand what Solmax is, and what it is becoming?

DRIVER 02

Connection

What they experience. The quote, the delivery, the site visit — day to day.

DRIVER 03

Confidence

What can be proved. Does Solmax deliver what it promised, repeatedly?

FOUNDATION

Integrity

All three rest on it. Without it, the other three are marketing.

One number. Working shown.

- **A 0–100 Trust Index.** The three drivers roll into one number — with the full breakdown always shown beneath it, never instead of it.
- **Trust read as alignment.** Between what Solmax intends, what stakeholders expect, and what they actually experience. The distance between those is where trust leaks.
- **Six groups, scored separately.** Customers and specifiers, employees, distributors, installers, investors, communities and regulators.
- **Never averaged.** One blended number would hide exactly the groups carrying the transition.
- **Segmented how you operate.** Region, vertical and product brand — so you see what the Solmax name is worth to GSE, MIRAFI and PROPEX, market by market.
- **A cycle, not an audit.** A baseline, then a read every four months: updated scores, what changed, and the actions that follow.

SAY THIS

“It reads trust as alignment — what we intend, what they expect, what they actually experience.”

Trust is whether they believe in what you do next.

Reputation measures what people **say** about you — aggregate, outside-in, always after the fact. Trust is held by specific stakeholders and earned through experience, so it moves **before** the results do.

What it does.

01

Spot the leaks

Find the groups and drivers where gaps are quietly eroding performance — before they show up in the numbers.

02

Prove impact

Show the board — and CDPQ — exactly where trust is strengthening, with evidence rather than assertion.

03

Make the next move

Know which story to lead with, backed by what stakeholders actually reward.

04

Learn from every move

Every read deepens the picture: what builds trust here, and what erodes it.

SAY THIS

“Reputation is what people say about what we've done. Trust is whether they believe in what we do next.”

Solmax already has a reading. 58.

Read from the public footprint alone — annual reports, disclosure, news. A **directional estimate, not a validated measurement**. It is the hypothesis the programme tests.

58
TRUST INDEX

On a foundation of Integrity. Four groups read: customers **strong**, investors **strong**, communities **mixed**, employees **thin**.

The story is the live question.

Mid-transition

Three C-suite seats refreshed in fourteen months. Americas and EMEA manufacturing consolidated, a new European centre underway. **The infrastructure is rebuilt; the story behind the rebuild is not yet visible.**

Not a Solmax problem — a pattern

In **eleven of the twelve sectors** read so far, Connection is the thinnest layer, trailing Clarity by around eighteen points. It is the say-do gap **no single function owns** — which is why it goes unmeasured, and why it belongs at SLT level rather than in one department's budget.

SAY THIS

“We scored 58 from public signal alone, and Connection is the thin layer. The programme replaces that estimate with something we can defend.”

Sense, Measure, Act. We're at step two.

DONE · JUNE 2026

01 · Sense

The Navigator — the hypothesis

Trust inferred from public signal alone. **Solmax read 58**, Connection thinnest. Free, and deliberately labelled an estimate.

THIS PROGRAMME

02 · Measure

The Snapshot — the test

Primary research replaces the estimate with a validated score. Four reads across twelve months — baseline October 2026, then February, June and October 2027. Six groups, not four.

ALONGSIDE

03 · Act

MissionCTRL — closing the gap

Each wave lands with the leaks ranked and the evidence to align the room. **Measuring the alignment gap is what TrustOS does; closing it is what MissionCTRL does.**

SAY THIS

“Sense was the free public read. Measure turns the estimate into evidence. Act closes the gap it finds.”

Surveys are the smallest part.

The tools you already run were not built to measure trust. NPS reads one question of one relationship. Employee surveys read one group. Reputation monitoring reads what's said about what you already did. **TrustOS reads the thing they all orbit** — from six sources, only one of which asks anything new.

SOURCE 01

Public signal

Reviews, employer ratings, media sentiment, tender and award outcomes. Twelve sectors already read this way.

SOURCE 02

Data Solmax already holds

NPS, CSAT, engagement, retention, churn. Measured once by someone else, reused here.

SOURCE 03

Behavioural signal

Repeat orders, quote-to-order conversion, tool usage, vertical-page engagement. What people do, not what they say.

The other three.

SOURCE 04

Embedded micro-pulses

One question in the flow — after a quote, a delivery, a training session. On the channel each group already uses. WhatsApp included.

SOURCE 05

AI-moderated conversations

Short adaptive interviews, chat or voice, any language, at scale. Richer than a survey at a fraction of fieldwork cost.

SOURCE 06

The moments of truth

Win/loss debriefs, exit conversations, frontline sentiment logged by your own teams. Where people say what they actually think.

SAY THIS

“Most of what we need is already being said. We read it where it already exists — surveys only fill what's left.”

How we do the surveys.

Five of the six sources ask nobody anything new, so the asking is kept to the minimum that fills the gaps. Where we do ask, this is exactly how.

- **Short pulses, not questionnaires.** A handful of questions designed per group — never one long survey pushed at everybody.
- **Inside touchpoints that already exist.** After a quote, after a delivery, at the end of a training session, at a trade-show scan. Nobody is asked to attend anything new.
- **On the channel they already use.** Email, portal, in-session, WhatsApp. We meet each group where it already is.
- **Through relationships you already have.** Distributed via your own channels and contacts — never a cold panel.
- **In their language.** Multi-language deployment across the 58-country footprint, not English with a translation apology.
- **Confidential, and cleared first.** Compliance signed off before anyone is contacted — works councils in Germany and wider EMEA, PIPL for Zhuhai, Law 25 in Quebec, LGPD, PDPA, US state law.
- **Asked identically every wave.** Same questions, comparable group, same way — so the movement we report is real movement, not the method shifting underneath us.

Sized, and run properly.

- **Sized properly.** Sample sizes and statistical thresholds set per group with our methodology lead at design. Brought to you, not guessed at.

Where the asking earns its place

Distributors and installers. No public trace, no CRM presence, no survey history — and they decide whether the product performs on site.

Who runs them

We do — fastest, consistent across regions. **Or Solmax does** — using our templates and question set, so comparability holds. **Or a mix**, group by group. Your call.

SAY THIS

“Short pulses, in their language, inside touchpoints that already happen — asked the same way every wave so the trend is real.”

Three tests. Everything else is noise.

There is no shortage of ways to ask people things. The discipline is in what gets refused. Every candidate method faces the same three tests.

Reliability

Same question, same way, every wave

If a method can't be repeated identically, any movement it shows might be the method moving, not the trust.

Would this read the same next wave if nothing had changed?

Validity

Measuring belief, not adjacency

Every source is weighed for what it adds to Clarity, Connection or Confidence. Satisfaction, traffic and sentiment are not trust, however easy they are to collect.

Is this measuring belief, or just activity?

Sustainability

Rides inside work you already do

CRM, training, site visits — adapted as slightly as possible. Anything needing new effort decays by wave three.

Can this run at every wave without heroics?

Live in six weeks. Board-ready from read one.

The instrument is not handed over — it is installed. The first three steps assess what Solmax already holds. Your time in all of it: about an hour a wave.

WEEKS 1-2

01 · Assess

What already exists

Short structured conversations with the people who own the data — CRM, regional marketing, HR, IR, tools.

OUTPUT

The gap map — where each group can already be heard, and where it cannot.

WEEKS 2-3

02 · Select

Choose the mix

Every candidate method through the three tests, then ranked on signal quality against effort to run.

OUTPUT

The completed Signal Atlas: the listening mix, group by group.

WEEKS 3-6

03 · Configure

Build the instrument

Drivers weighted, sampling frames set, channels opened, 58 countries of language, compliance cleared.

OUTPUT

A live instrument, comparability rules locked.

Read. Act. Repeat.

OCTOBER 2026

04 · Baseline

Estimate becomes evidence

The validated Trust Index replaces the 58. Every group scored separately, segmented, board-ready.

OUTPUT

The zero point the 2027 plan is written from.

FEB · JUN · OCT 2027

05 · Waves

Measure the movement

Updated scores and a what-changed narrative tied to real events. One working hour a wave to read it together. Four reads across twelve months, closing on the anniversary.

OUTPUT

A trend line, and every refinement checked against it.

FROM READ ONE

06 · Act

Close the gaps

Each wave lands with the leaks ranked and the evidence to align leadership. Measurement that stops at a score is a report, not an instrument.

OUTPUT

Prioritised actions, owned and tracked into the next wave.

Six groups. Where each can be heard.

The Navigator read four groups from public signal. The programme reads six — because two of the groups that decide whether Solmax performs leave almost no public trace.

Customers & Specifiers

STRONGEST

CRM lead flow, 1,500 H1 web leads, quote and order history.

CRM behavioural telemetry

low

Digital & tools engagement

v. low

Employees

THIN

Engagement data where run, retention, Glassdoor and Indeed signal.

Existing engagement data

v. low

Micro-pulses in the flow

low

Distributors & Partners

PRIORITY GAP

Order and margin data exist; sentiment is anecdote. No public signal at all.

Commercial behaviour

low

Frontline sentiment capture

low

And the other three.

Installers & Engineers

THINNEST

No public signal, no CRM presence, no survey history — yet they decide how the product performs.

Investors & Lenders

STRONG

CDPQ lead since 2017, Fonds FTQ since 1996. Board packs, lender reporting, rating actions.

Communities & Regulators

PUBLIC-RICH

Permits, environmental filings, local media and consultation records across 58 countries.

SAY THIS

“The public read saw customers and investors. It couldn't see distributors or installers at all.”

Built on what's already moving.

TrustOS arrives into a marketing programme in full flight. Each of these either feeds the instrument or is fed by it. **Nothing below is new work.**

- **CRM lead flow.** APAC live 1 Sept, EMEA 1 Nov. Behavioural telemetry becomes fully readable from 1 November — exactly when the baseline needs it.
- **Vertical websites.** Mining first, five to follow. Every launch is a natural experiment: Clarity is read before Mining goes live, so each gets a clean before-and-after.
- **Thirty engineering tools.** One light analytics standard makes them reportable in one place — and gives build/adapt/retire decisions evidence instead of anecdote.
- **Training & the Academy.** Audiences already convened, at zero extra cost. Micro-pulses ride along from day one.
- **Distributor branding & audits.** Shared instrument design means distributors are asked once, not twice.
- **The 2027 integrated plan.** The baseline reads first, in October, so every 2027 initiative can carry a trust KPI from a measured start.

Two things, and neither is legwork.

ASK 01

Three introductions

MissionCTRL contacts the function leads directly — CRM, regional marketing, HR, IR, tools owners. You make the introductions; we do the rest. **By-product:** every conversation warms a relationship with the people who will live with the tracker, so adoption starts before the baseline does.

ASK 02

One note from legal

Before fieldwork, not after. Beyond GDPR: works councils in Germany and wider EMEA, PIPL for Zhuhai, PIPEDA and Quebec Law 25, LGPD, Malaysia PDPA, US state privacy law, and consent rules for recording by country. **This page is written so you can forward it as-is.**

October 2026

Baseline. The 58 becomes a measured number

Feb · Jun · Oct 2027

Three further reads, four months apart

£52,500 year one

Design-partner rate, billed £13,125 a quarter

The short answers.

What is TrustOS?

Trust Intelligence — it reads the state of every stakeholder relationship as a **0–100 Trust Index**, and shows where trust is leaking before the numbers move.

What does it measure?

Alignment — between what we intend, what stakeholders expect and what they experience. **Clarity, Connection, Confidence**, on Integrity, scored per group.

Haven't we got a score already?

We have 58, but that is **inferred from public signal alone**. This programme replaces it with primary research we can defend.

How are we doing the surveys?

Short pulses per group, inside touchpoints that already happen, in their language, asked the same way every wave. **Five of the six sources ask nobody anything new.**

And the last three.

Isn't this another survey programme?

No. If a method can't run at every wave inside work we already do, it doesn't make the mix. **We built it around not asking twice.**

How is it different from NPS or a brand tracker?

NPS is one question of one relationship; brand tracking measures what's said. **Neither warns you before the numbers move.** TrustOS is built to.

Why now, and what does it cost?

Live in six weeks means the baseline reads in **October, before the 2027 plan is written.** £52,500 for year one, billed quarterly.

IN ONE LINE

"Trust isn't an opinion about us — it's the state of the relationship. TrustOS makes it our North Star: one index, six groups, four reads a year, mostly from signal we already have."
