

TRUST INTELLIGENCE · MAKE TRUST YOUR NORTH STAR

How we measure. How we listen.

Solmax already has a reading — 58, from public signal alone. This is what it takes to replace an estimate with evidence, and to keep it moving wave after wave.

WHAT'S INSIDE

01	What TrustOS reads
02	The evidence
03	Where Solmax stands today
04	Sense · Measure · Act
05	How we listen, and what we refuse
06	How we do the surveys
07	Six weeks to the baseline
08	The Signal Atlas, at a glance
09	Built on what's already moving
10	What happens next
11	The short answers

One thing measured. Trust.

Solmax measures everything it **does** — and almost nothing about how it is **experienced**. TrustOS reads the state of every stakeholder relationship: a leading indicator of resilience and growth that warns you before the numbers move.

Trust isn't an opinion about you. It's the state of a relationship with you.

DRIVER 01

Clarity

What's said. Do people understand what Solmax is, and what it is becoming?

DRIVER 02

Connection

What they experience. The quote, the delivery, the site visit — day to day.

DRIVER 03

Confidence

What can be proved. Does Solmax deliver what it promised, repeatedly?

FOUNDATION

Integrity

All three rest on it. Without it, the other three are marketing.

One number, working shown

The three drivers roll into a single **0–100 Trust Index** — with the full breakdown always shown beneath it, never instead of it.

Trust read as alignment

Between what Solmax **intends**, what stakeholders **expect**, and what they actually **experience**. The distance between those is where trust leaks.

Every group scored separately

Six groups for Solmax, segmented by region, vertical and brand. **Never averaged** — one blended number hides the groups carrying the transition.

SAY THIS

“It reads trust as alignment — what we intend, what they expect, what they actually experience. One index, three drivers, every group scored separately.”

Trust is whether they believe in what you do next.

Reputation measures what people **say** about you — aggregate, outside-in, and always after the fact. Trust is held by specific stakeholders and earned through experience, so it moves **before** the results do. That is the difference between a rear-view mirror and an instrument.

01

Spot the leaks

Find the groups and drivers where
gaps are quietly eroding performance.

02

Prove impact

Show the board — and CDPQ —
exactly where trust is strengthening,
with evidence rather than assertion.

03

Make the next move

Know which story to lead with, backed
by what stakeholders actually reward.

04

Learn from every move

Every read deepens the picture: what
builds trust here, and what erodes it.

SAY THIS

“Reputation is what people say about what we've done. Trust is whether they believe in what we do next — and it moves first, which is the whole point.”

Solmax already has a reading. 58.

The TrustOS Navigator read Solmax from its public footprint alone — annual reports, disclosure, news. It is a **directional estimate, not a validated measurement**, and we label it that way on purpose. It is the hypothesis the programme tests.

Clarity 65

Connection — where it leaks 52

Confidence 58

On a foundation of Integrity. Four groups read from public signal: customers **strong**, investors **strong**, communities **mixed**, employees **thin**.

Mid-transition — and the story is the live question

Three C-suite seats refreshed in fourteen months. Americas and EMEA manufacturing consolidated, a new European centre underway. **The infrastructure is rebuilt; the story behind the rebuild is not yet visible.** That is the Connection gap — the distance between the rebuild and the story stakeholders hear.

Not a Solmax problem — a pattern

In **eleven of the twelve sectors** read so far, Connection is the thinnest layer, trailing Clarity by around eighteen points. It is the say-do gap **no single function owns**, which is exactly why it goes unmeasured — and why it belongs at SLT level rather than inside one department's budget.

SAY THIS

“We already scored 58 from public signal alone, and Connection is the thin layer. The programme replaces that estimate with something we can actually defend.”

Sense, Measure, Act. Solmax is at step two.

The same three steps run for every TrustOS client. The honesty about which step you are on is the point — a public-signal read is a hypothesis, and we never present it as more than that.

DONE · JUNE 2026

01 · Sense

The Navigator — the hypothesis

Trust inferred from public signal alone: annual reports, disclosure, news, the public footprint. **Solmax read 58**, with Connection thinnest. A directional estimate — free, and deliberately labelled as an estimate.

THIS PROGRAMME

02 · Measure

The Snapshot — the test

Primary research across your stakeholders replaces the estimate with a validated score, tracked read over read. **Four reads across twelve months** — baseline October 2026, then February, June and October 2027. Six groups, not four, scored separately and segmented by region, vertical and brand.

ALONGSIDE

03 · Act

MissionCTRL — closing the gap

Measurement that stops at a score is a report. Each wave lands with the leaks ranked and the evidence to align the room. **Measuring the alignment gap is what TrustOS does; closing it is what MissionCTRL does** — the consulting programme, proposed separately.

Why the estimate is not enough

58 is read from the outside. It cannot tell you whether your employees understand the rebuild, or whether distributors still believe you. Only primary research can, and only repetition makes it a trend.

What the Snapshot adds

A validated Trust Index per group, the driver breakdown beneath it, and the movement between waves tied to real events — the launches, the go-lives, the reorganisation.

Three moves it will test

Tell the transformation. Make sustainability the growth story. Lead the category with proof. **The Navigator proposed them; the Snapshot says which one stakeholders would actually reward.**

SAY THIS

“Sense was the free public read. Measure is this programme — it turns the estimate into evidence. Act is the work that closes the gap it finds.”

Surveys are the smallest part of it.

The tools Solmax already runs were not built to measure trust. NPS reads one question of one relationship; employee surveys read one group; reputation monitoring reads what is being said about what you have already done. TrustOS reads the thing they all orbit — and mostly from signal that already exists.

SIX SOURCES — ONLY ONE ASKS ANYTHING NEW

01 · Public signal

Reviews, employer ratings, media sentiment, tender and award outcomes. Twelve sectors already read this way.

02 · Data Solmax already holds

NPS, CSAT, engagement, retention, churn — measured once by someone else, reused here.

03 · Behavioural signal

Repeat orders, quote-to-order conversion, tool usage, vertical-page engagement. What people do.

04 · Embedded micro-pulses

One question in the flow — after a quote, a delivery, a training session. WhatsApp included.

05 · AI-moderated conversations

Short adaptive interviews, chat or voice, any language, at a fraction of fieldwork cost.

06 · The moments of truth

Win/loss debriefs, exit conversations, frontline sentiment logged by your own teams.

THREE TESTS — WHAT GETS REFUSED

Reliability

Asked the same way, of a comparable group, every wave. Otherwise the movement might be the method moving, not the trust. **Would this read the same next wave if nothing had changed?**

Validity

It must measure trust, not adjacency. Satisfaction, traffic and sentiment are not trust, however easy they are to collect. **Is this measuring belief, or just activity?**

Sustainability

It rides inside work Solmax already does — CRM, training, site visits — adapted as slightly as possible. Anything needing new effort decays by wave three. **Can this run at every wave without heroics?**

SAY THIS

“If a method can't be repeated at every wave inside work we already do, it doesn't make the mix. That's the whole discipline.”

How we do the surveys.

The honest headline: five of the six sources ask nobody anything new, so the asking is kept to the minimum that fills the gaps. Where we do ask, this is exactly how — and it is designed so nobody is asked to attend anything new.

Short pulses, not questionnaires

A handful of questions designed per group — never one long survey pushed at everybody.

Inside touchpoints that already exist

After a quote, after a delivery, at the end of a training session, at a trade-show scan.

On the channel they already use

Email, portal, in-session, WhatsApp. We meet each group where it already is.

Through relationships you already have

Distributed via your own channels and contacts. Never a cold panel.

In their language

Multi-language deployment across the 58-country footprint — not English with a translation apology.

Confidential, and cleared first

Compliance signed off before anyone is contacted: works councils, PIPL, Law 25, LGPD, PDPA, US state law.

Identical every wave

Same questions, comparable group, same way — so the movement is real movement, not the method shifting underneath.

Sized properly

Sample sizes and statistical thresholds set per group with our methodology lead at design — brought to you, not guessed at.

Where the asking earns its place

Distributors and installers. There is no shortcut for these two — almost no public trace, no CRM presence, no survey history. And they are the groups that decide whether the product performs on site. This is where a well-designed ask is worth more than any amount of inferred signal.

Who runs them

Three options, and it can be mixed group by group:

We run them — fastest, and consistent across regions.

Solmax runs them — using our templates and question set, so comparability holds.

A mix — you take the groups you already have channels into; we take the rest.

SAY THIS

“Short pulses, in the language they speak, inside touchpoints that already happen — and asked the same way every wave so the trend is real.”

Live in six weeks. Board-ready from your first read.

The instrument is not handed over — it is installed. The first three steps assess what Solmax already holds, so the listening mix is chosen against reality rather than a template. **Your time in all of it: about an hour a wave.**

INSTALL THE INSTRUMENT

Assess what exists, choose the mix, configure and clear compliance — six weeks from sign-off

01

WEEKS 1-2

Assess

What already exists

Short structured conversations with the people who own the data — CRM, regional marketing, HR, IR, tools. What exists, who owns it, how it is collected, how good it is.

OUTPUT

The gap map — where each group can already be heard, and where it cannot.

02

WEEKS 2-3

Select

Choose the mix

Every candidate method put through the three tests, then ranked on signal quality against effort to run.

OUTPUT

The completed Signal Atlas: the listening mix, group by group.

03

WEEKS 3-6

Configure

Build the instrument

Drivers weighted per group, sampling frames set, channels opened, languages set across 58 countries, compliance cleared with legal.

OUTPUT

A live instrument, comparability rules locked.

MEASURE

Baseline, then every four months at board cadence

04

OCTOBER 2026

Baseline

Estimate becomes evidence

The validated Trust Index replaces the 58. Every group scored separately, segmented, board-ready.

OUTPUT

The zero point the 2027 plan is written from.

05

FEB · JUN · OCT 27

Waves

Measure the movement

Updated scores and a what-changed narrative tied to real events. One working hour a wave to read it together.

OUTPUT

A trend line, and every refinement checked against it.

ACT

Close the gaps

06

FROM READ ONE

Act

Close the gaps

Each wave lands with the leaks ranked and the evidence to align leadership behind fixing them. Measurement that stops at a score is a report.

OUTPUT

Prioritised actions, owned and tracked into the next wave.

SAY THIS “Six weeks from sign-off to a validated baseline — and the first three weeks are spent working out what we already have, so we only build what's missing.”

Six groups. Where each one can be heard.

The Navigator read four groups from public signal. The programme reads six, because two of the groups that decide whether Solmax performs — distributors and installers — leave almost no public trace. **Bars show signal quality; the note beside each shows effort to run.**

SAY THIS

“The public read could see customers and investors. It couldn't see distributors or installers at all — and those are the people who decide whether the product performs.”

Built on what's **already moving.**

TrustOS does not arrive into a blank page — it arrives into a marketing programme in full flight. Each of these either feeds the instrument or is fed by it. Nothing below is new work.

CRM lead flow

APAC live 1 Sept, EMEA 1 Nov, training Oct–Nov. → Behavioural telemetry — the top-ranked customer and distributor signal — becomes fully readable from 1 November, exactly when the baseline needs it.

Vertical websites

Mining first, five to follow. → Every launch is a natural experiment. Clarity is read **before** Mining goes live, so each launch gets a clean before-and-after.

Thirty engineering tools

Usage data scattered across six platforms. → One light analytics standard makes thirty tools reportable in one place, and gives build/adapt/retire decisions evidence instead of anecdote.

Training & the Academy

Containment modules and CRM training to Jan 2027. → Audiences already convened, at zero extra cost. Micro-pulses ride along from day one.

Distributor branding & audits

A named pain point, regional audits planned. → Shared instrument design means distributors are asked once, not twice. One ask, two outputs.

The 2027 integrated plan

Lands by December. → The baseline reads first, in October, so every 2027 initiative can carry a trust KPI from a measured start.

SAY THIS

“It rides on the programmes we're already running. The CRM rollout and the vertical launches become measurement instruments as well as projects.”

Two things, and none of the legwork is yours.

Step 01 can start before sign-off. The right listening mix depends on what Solmax actually holds, and the fastest way to find that out is not a questionnaire to you.

ASK 01

Three introductions

MissionCTRL contacts the function leads directly — CRM, regional marketing, HR, IR and the tools owners — with short structured conversations. You make the introductions; we do the rest.

A by-product worth having: every discovery conversation warms a relationship with the people who will live with the tracker, so adoption starts before the baseline does.

ASK 02

One note from legal

Before fieldwork, not after. The compliance picture beyond GDPR: works councils in Germany and wider EMEA, PIPL for Zhuhai, PIPEDA and Quebec Law 25, LGPD, Malaysia PDPA, US state privacy law, and consent rules for recording by country.

A single note listing what applies where lets every method be designed compliant from day one — and makes the programme far easier to defend in any room.

Early September

Sign-off

Sept – October

Assess, select, configure — six weeks

October 2026

Baseline. The 58 becomes a measured number

Feb · Jun · Oct 2027

Three further reads, four months apart, each acted on

£52,500 year one

Design-partner rate, 30% below standard, billed £13,125 a quarter

The short answers.

Six questions, six sentences. Everything else in this document is the evidence behind them.

What is TrustOS?

Trust Intelligence — it reads the state of every stakeholder relationship as a **0–100 Trust Index**, and shows where trust is leaking before the numbers move.

Haven't we already got a score?

We have 58, but that is **inferred from public signal alone** — a directional estimate. This programme replaces it with primary research we can defend.

How is it different from NPS or a brand tracker?

NPS is one question of one relationship; brand tracking measures what's said. **Neither warns you before the numbers move.** TrustOS is built to.

What does it actually measure?

Alignment — between what we intend, what stakeholders expect and what they experience. **Clarity, Connection, Confidence**, on a foundation of Integrity, scored per group.

Isn't this another survey programme?

No. Most of it reads signal that already exists, and if a method can't run at every wave inside work we already do, it doesn't make the mix.

Why now, and what does it cost?

Live in six weeks means the baseline reads in **October, before the 2027 plan is written**. £52,500 for year one, billed quarterly across the twelve months.

IN ONE LINE

“Trust isn't an opinion about us — it's the state of the relationship. TrustOS makes it our North Star: one index, six groups, four reads a year, mostly from signal we already have.”
